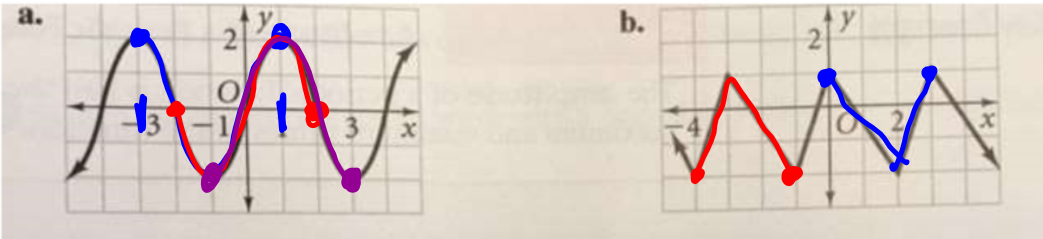
13.1 Exploring Periodic Data

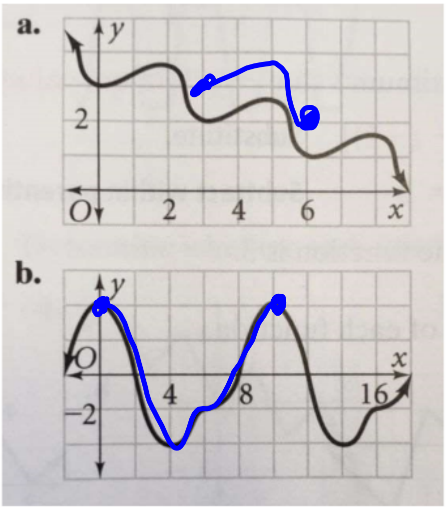
Periodic function - repeats a pattern of y-vales (outputs) at regular intervals.
Cycle - 1 complete pattern. A cycle may begin at any point on the graph of the function.
Period - the horizontal length of 1 cycle, - in terms of x-values.

Example 1: Identifying Cycles and Periods
Analyze the periodic function. a) Identify 1 cycle in two different ways. b) Determine the period of the function.



$1-(-3) = 4$ units $3-0=3$ units

Example 2: Identifying Periodic Functions
Determine whether each function is or is not periodic. If it is, find the period.



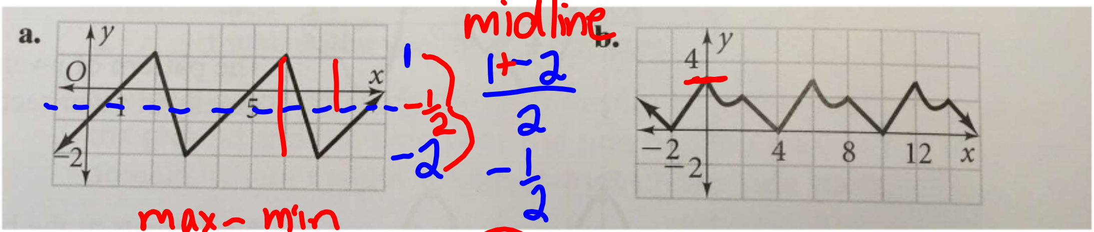
not periodic

periodic
9 units

$9-0$

Amplitude - of a periodic function measures the amount of variation in the y-values. To find the amplitude:

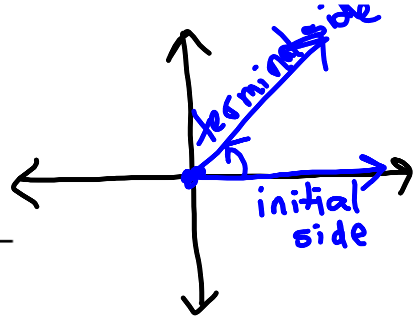
Example 3: Find the Amplitude of the periodic function.



max − min

amp: $\frac{1-(-2)}{2} = \frac{3}{2}$

amp: $\frac{max_y - min_y}{2} = \frac{3-0}{2} = \frac{3}{2}$



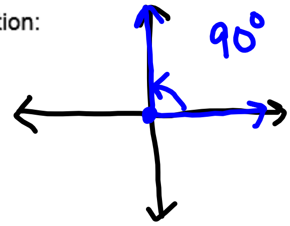
13.2 Angles (day 1)

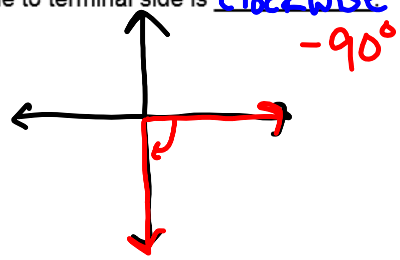
An **angle in standard position** has:

- vertex is at the origin
- one ray is on the x-axis

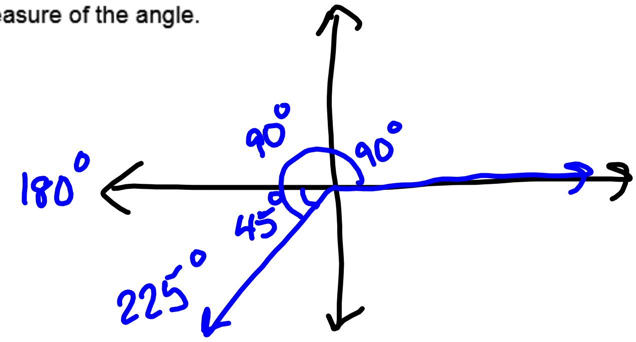
Initial side - the ray on the positive x-axis
Terminal side - the other ray of the angle
The **measure of an angle in standard position** is the amount of rotation from the initial side to the terminal side.
The measure of an angle is **positive** when the rotation from the initial side to terminal side is counterclockwise
The measure of an angle is **negative** when the rotation from the initial side to terminal side is clockwise

Sketch and angle in standard position:





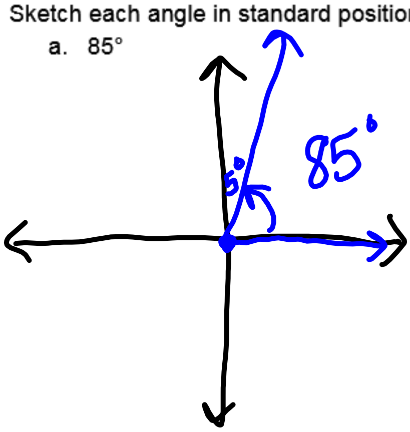
Example 1: Measuring an Angle in Standard Position
Find the measure of the angle.



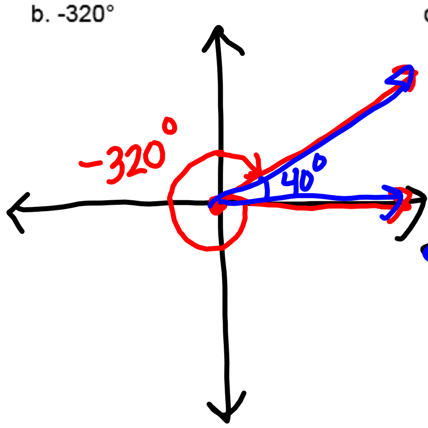
$90 + 90 + 45$

Example 2: Sketching an Angle in Standard Position
Sketch each angle in standard position.

a. 85°

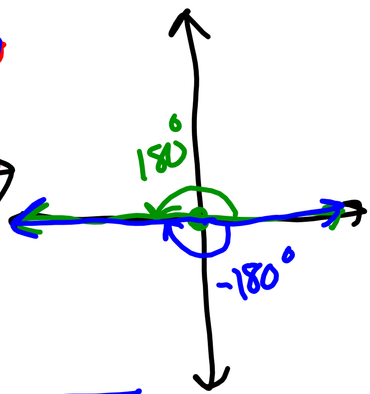


b. -320°



$\boxed{-320} + 360$
$\boxed{40°}$

c. 180°



$\boxed{180°} - 360°$
$\boxed{-180°}$

Coterminal Angles - Two angles in standard position are coterminal if they have the same terminal side. For any given angle, there are infinitely many coterminal angles. To find a coterminal angle, **add or subtract 360°.**

Example 3: Finding Coterminal Angles

a. Find a positive angle and a negative angle that are coterminal with 198°.

$198° + 360° = 558°$

$198° - 360° = -162°$

b. Are the angles with measure 40° and 680° coterminal? Explain.

$40°$ $680°$ not coterminal. the difference is not a multiple of 360°

$680 - 40 = \frac{640}{360} = X$

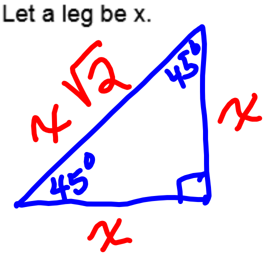
c. Find the measure of an angle between 0° and 360° coterminal with 385°.

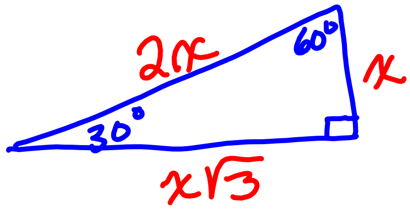
$385° - 360° = 25°$

d. Find the measure of an angle between 0° and 360° coterminal with -356°.

$-356° + 360 = 4°$

Recall: Special Right Triangles

45°-45°-90° Let a leg be x.	30°-60°-90° Let the shorter leg be x.
	




Find the missing side lengths in each 45°-45°-90° triangle. Rationalize any denominators.

1. hypotenuse = 1 inch

$x\sqrt{2} = 1$

$\frac{x\sqrt{2}}{\sqrt{2}} = \frac{1}{\sqrt{2}}$

$x = \frac{1}{\sqrt{2}} \cdot \frac{\sqrt{2}}{\sqrt{2}} = \frac{\sqrt{2}}{2}$

$\boxed{\frac{\sqrt{2}}{2}x}$ $\boxed{x = \frac{\sqrt{2}}{2}}$

2. leg = 2 cm

$2 = x$ $\boxed{x = 2}$ $\boxed{x\sqrt{2}\ 2\sqrt{2}}$

3. hypotenuse = √3 ft

$\sqrt{3} = x\sqrt{2}$ x x

$\frac{x\sqrt{2}}{\sqrt{2}} = \frac{\sqrt{3}}{\sqrt{2}}$

$x = \frac{\sqrt{3}\sqrt{2}}{\sqrt{2}\sqrt{2}}$

$\boxed{x = \frac{\sqrt{6}}{2}}$

Find the missing side lengths in each 30°-60°-90° triangle. Rationalize any denominators.

4. shorter leg = 3 inch

$2x = \boxed{6in}$ $3 = x$

$x\sqrt{3} = \boxed{3\sqrt{3}in}$

5. longer leg = 1 cm

s: $x = \boxed{\frac{\sqrt{3}}{3}cm}$

l: $x\sqrt{3} = 1$

$\frac{x\sqrt{3}}{\sqrt{3}} = \frac{1}{\sqrt{3}}$

$x = \frac{1}{\sqrt{3}} \cdot \frac{\sqrt{3}}{\sqrt{3}}$

$x = \frac{\sqrt{3}}{3}$

h: $2x = \boxed{\frac{2\sqrt{3}}{3}cm}$

$2 \cdot \frac{\sqrt{3}}{3} =$

6. hypotenuse = 1 ft

s: $x = \boxed{\frac{1}{2}ft}$

l: $x\sqrt{3} = \frac{1}{2} \cdot \sqrt{3}$ $\boxed{\frac{\sqrt{3}}{2}ft}$

h: $\frac{2x}{2} = \frac{1}{2}$

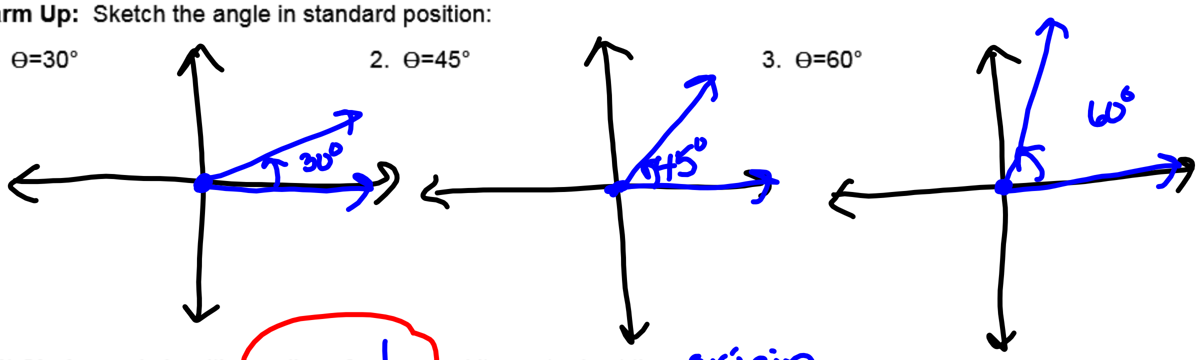
$x = \frac{1}{2}$

θ angle

13.2 The Unit Circle (day 2)

Warm Up: Sketch the angle in standard position:

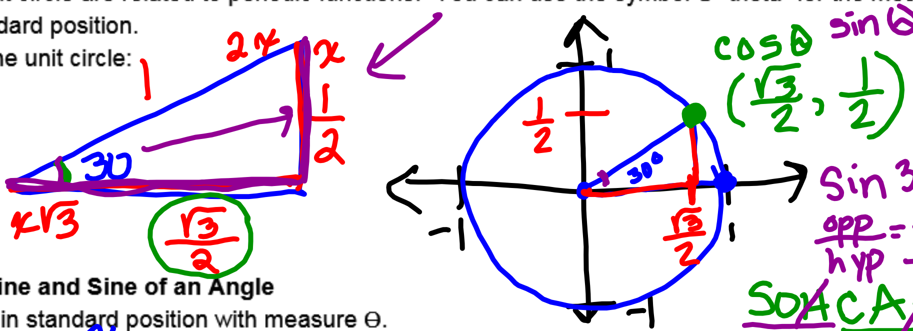
1. θ=30° 2. θ=45° 3. θ=60°



Unit Circle - a circle with a radius of 1 and its center is at the origin

Points on the unit circle are related to periodic functions. You can use the symbol θ "theta" for the measure of an angle in standard position.

Sketch the unit circle:



$\cos 30^\circ$ $\frac{adj}{hyp} = \frac{\frac{\sqrt{3}}{2}}{1}$

$\sin 30^\circ$ $\frac{opp}{hyp} = \frac{\frac{1}{2}}{}$

SOHCAHTOA

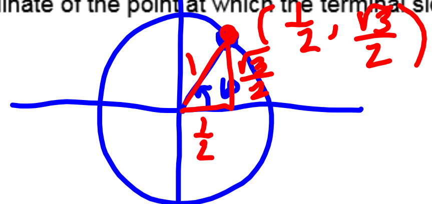
Definition: Cosine and Sine of an Angle

Given: an angle in standard position with measure θ.

The **cosine of θ** is the x -coordinate of the point at which the terminal side intersects the unit circle.

The **sine of θ** is the y -coordinate of the point at which the terminal side intersects the unit circle.

Sketch:

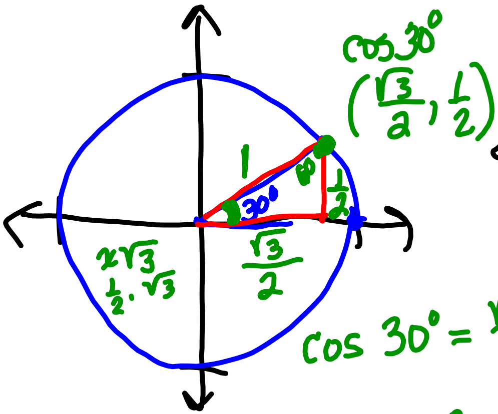


$\cos 60^\circ = \frac{1}{2}$

$\sin 60 = \frac{\sqrt{3}}{2}$

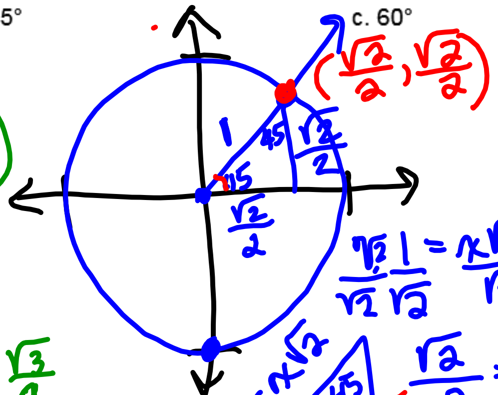
Example 4&5: Find the cosine and sine of the angle. Provide a sketch of the angle in standard position.

a. 30° b. 45° c. 60°

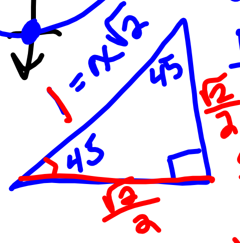


$\cos 30^\circ = \frac{\sqrt{3}}{2}$

$\sin 30^\circ = \frac{1}{2}$



$\frac{\sqrt{2}}{\sqrt{2}} \cdot \frac{1}{\sqrt{2}} = \frac{x\sqrt{2}}{\sqrt{2}}$



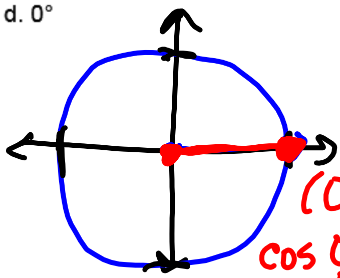
$\frac{\sqrt{2}}{2} = x$

$\sin = \frac{\frac{\sqrt{2}}{2}}{1} = \frac{\sqrt{2}}{2}$

$\cos 45^\circ = \frac{\sqrt{2}}{2} / 1 = \frac{\sqrt{2}}{2}$

Find the cosine and sine of the angle. Provide a sketch of the angle in standard position.

d. 0°

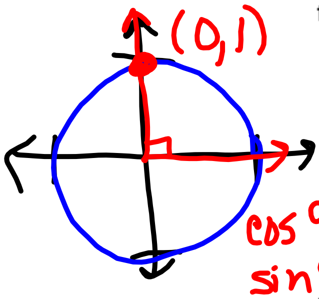


(0, 0)

cos 0° = 0

sin 0° = 0

e. 90°

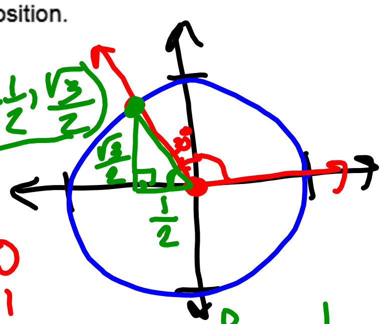


(0, 1)

cos 90° = 0

sin 90° = 1

f. 120°

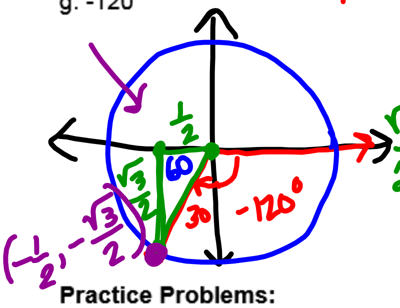


$\left(-\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$

$\cos 120° = -\frac{1}{2}$

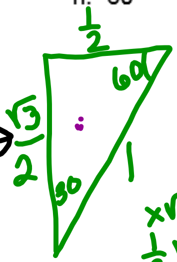
$\sin 120° = \frac{\sqrt{3}}{2}$

g. -120°



$\left(-\frac{1}{2}, -\frac{\sqrt{3}}{2}\right)$

h. -60°



$\sin 60° = \frac{opp}{hyp} = \frac{\sqrt{3}}{2}$

$\cos 60° = \frac{adj}{hyp} = \frac{1}{2}$

$\times\sqrt{3}$

$\frac{1}{2}\sqrt{3} = \frac{\sqrt{3}}{2}$

$\sin(-120°) = -\frac{\sqrt{3}}{2}$

$\cos(-120°) = -\frac{1}{2}$

i. 150°

Practice Problems:

Calculator Needed: For angles that are not a multiple of 30° or 45°, you will need your calculator. Find cosΘ and sinΘ.

1. Θ=32°

cos 32° = 0.834

sin 32° = 0.551

2. Θ=-210°

cos(-210)° = -0.884

sin(-210)° = -0.468

3. Θ=-10°

Find a positive and negative coterminal angle for the given angle. ± 360°

4. 3. Θ=400°

(+360) = 760°

400 − 360 = 40°

40 − 360 = −320°

5. Θ=-125°

−125 + 360 = 235°

−125 − 360 = −485°

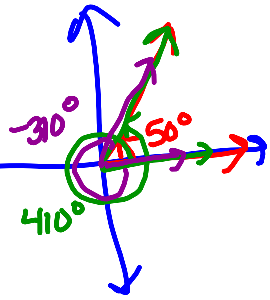
6. 3. Θ=-57°

$\boxed{-417°}$

−57 − 360

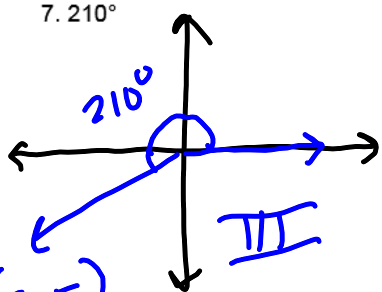
−57 + 360

$\boxed{303°}$



In which quadrant, or on which axis, does the terminal side of each angle lie? Sketch the angle to help you.

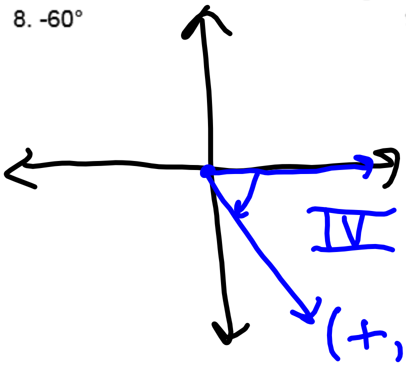
7. 210°



III

(−, −)

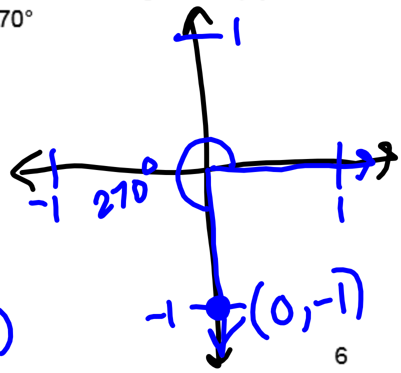
8. -60°



IV

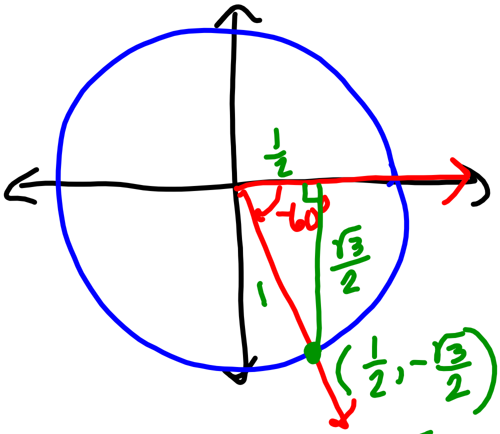
(+, −)

9. 270°



(0, −1)

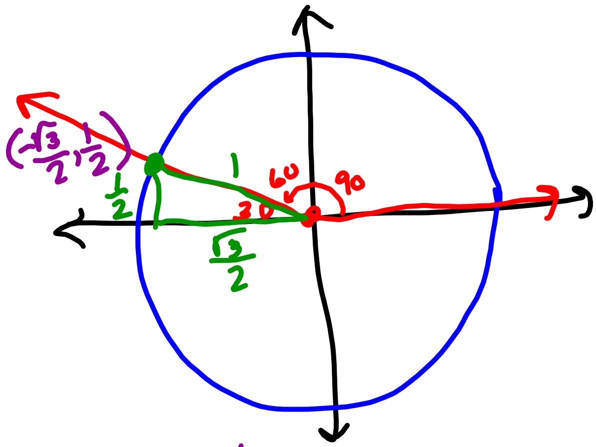
h. $-60°$



$\sin(-60°) = -\frac{\sqrt{3}}{2}$

$\cos(-60°) = \frac{1}{2}$

i. $150°$



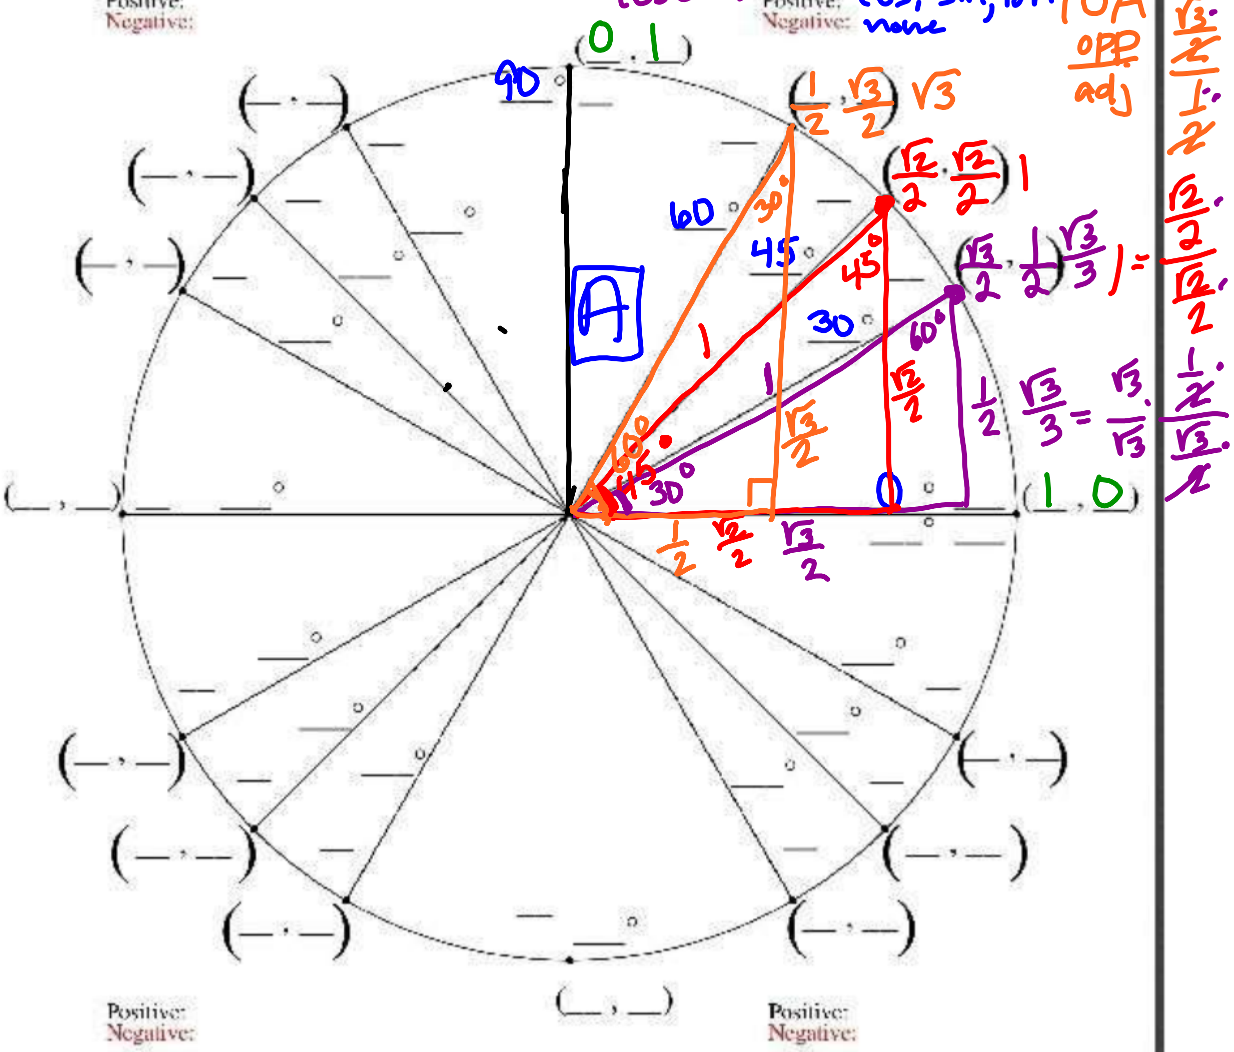
y: $\sin 150° = \frac{1}{2}$

x: $\cos 150° = -\frac{\sqrt{3}}{2}$

$(\cos\theta, \sin\theta)$

Fill in The Unit Circle

$\tan\theta = \frac{\sin\theta}{\cos\theta} = \frac{y}{x}$



13.3 Radian Measure (Day 1)

Warm Up: Find the circumference of a circle with the given radius or diameter. Round your answer to the nearest tenth.

1. radius 4 in $C = 2\pi r$

$C = 2\pi \cdot 4 = 8\pi$

25.1 in

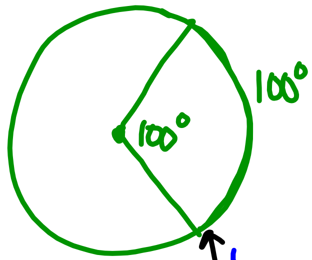
2. diameter 70 m $C = d\pi = 2\pi r$

$C = 70\pi$

219.9 m

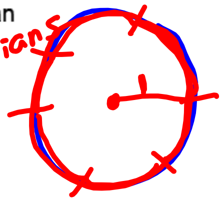
Central angle - an angle whose vertex is the center of a circle

sketch:

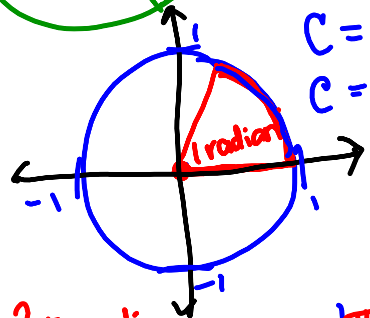


Intercepted arc - the portion of the circle with endpoints on the sides of the central angle and remaining points within the interior of the angle.

Radian - when the intercepted arc equals the radius, the measure of the angle is 1 radian



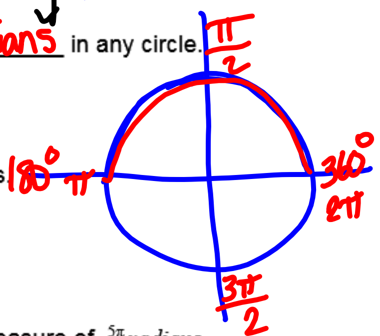
sketch:



$C = 2\pi \cdot 1$ radians

$C = 2\pi$

- The circumference of a circle is $2\pi r$. Thus there are 2π radians in any circle.
- Since $\frac{2\pi}{2}$ radians = $\frac{360}{2}$°, then π radians = 180°
- Thus you can use this proportion to convert between degrees and radians



$D \to R: \frac{\pi}{180°}$ $R \to D: \frac{180°}{\pi}$

Example 1: Use a proportion

a. Find the radian measure of 60°.

$\cancel{60°} \cdot \frac{\pi}{\cancel{180°}_{3}} = \frac{\pi}{3}$

b. Find the degree measure of $\frac{5\pi}{2}$ *radians*

$\frac{5\cancel{\pi}}{\cancel{2}} \cdot \frac{\cancel{180°}^{90}}{\cancel{\pi}} = 450°$

Converting between Radians and Degrees

- To convert degrees to radians, multiply by $\frac{\pi}{180^\circ}$
- To convert radians to degress, multiply by $\frac{180^\circ}{\pi}$

Example 2: Using Dimensional Analysis

Convert the angle to degrees. Round to the nearest degree.

a. $-\frac{3\pi}{4} radians$

$-\frac{3\cancel{\pi}}{\cancel{4}} \cdot \frac{\overset{45}{\cancel{180}}}{\cancel{\pi}}$

-135°

b. $\frac{\pi}{2} radians$

$\frac{\pi}{2} \cdot \frac{180^\circ}{\pi}$

90°

c. $2 radians$

$2\ \cancel{radians} \cdot \frac{180^\circ}{\pi\ \cancel{rad.}}$

$\frac{360^\circ}{\pi}$

Convert the angle to radians. Round to the nearest hundredth.

d. 27°

$\overset{3}{\cancel{27}}^\circ \cdot \frac{\pi}{\underset{20}{\cancel{180^\circ}}}$

$\boxed{\frac{3\pi}{20}}$ radians

e. 225°

$\overset{5}{\cancel{225}}^\circ \cdot \frac{\pi}{\underset{4}{\cancel{180^\circ}}}$

$\frac{5\pi}{4}$ radians

f. 150°

$\overset{5}{\cancel{150}}^\circ \cdot \frac{\pi}{\underset{6}{\cancel{180^\circ}}}$

$\boxed{\frac{5\pi}{6} \text{ radians}}$

Example 3: Find the exact values of cosΘ and sinΘ for each angle measure.

Step 1: Convert to degrees.

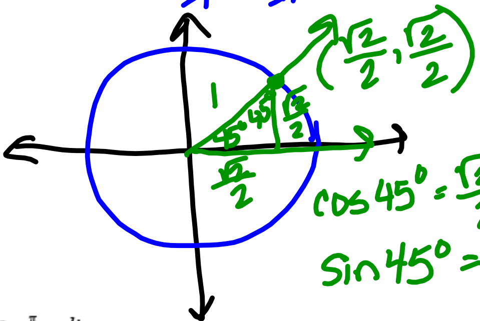
Step 2: Draw the angle. The terminal side is the hypotenuse.

Step 3: Complete the right triangle. Draw a leg to the ***x-axis***.

Step 4: State the cosΘ and sinΘ.

a. $\frac{\pi}{4} radians$

$\frac{\cancel{\pi}}{4} \cdot \frac{\overset{45}{\cancel{180}}}{\cancel{\pi}} = 45^\circ \rightarrow \frac{\pi}{4}$

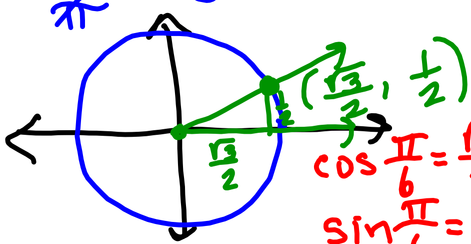


$\cos 45^\circ = \frac{\sqrt{2}}{2}$

$\sin 45^\circ = \frac{\sqrt{2}}{2}$

b. $\frac{\pi}{6} radians$

$\frac{\cancel{\pi}}{\cancel{6}} \cdot \frac{\overset{30}{\cancel{180}}}{\cancel{\pi}} = 30^\circ \longrightarrow \frac{\pi}{6}$

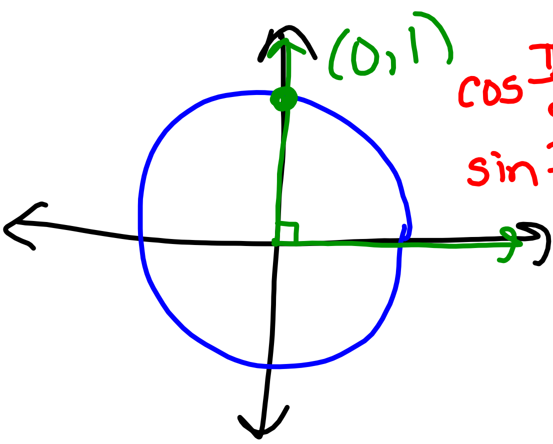


$\cos \frac{\pi}{6} = \frac{\sqrt{3}}{2}$

$\sin \frac{\pi}{6} = \frac{1}{2}$

c. $\frac{\pi}{2} radians$

$\frac{\cancel{\pi}}{\cancel{2}} \cdot \frac{\overset{90}{\cancel{180}}}{\cancel{\pi}} = 90^\circ \rightarrow \frac{\pi}{2}$

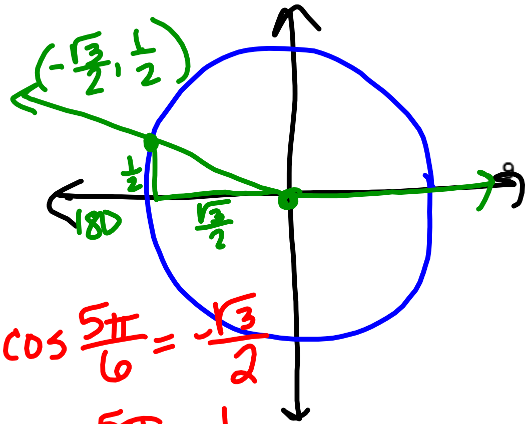


$\cos \frac{\pi}{2} = 0$

$\sin \frac{\pi}{1} = 1$

d. $\frac{5\pi}{6} radians$

$\frac{5\pi}{\cancel{6}} \cdot \frac{\overset{30}{\cancel{180}}}{\pi} = 150^\circ$



$\cos \frac{5\pi}{6} = -\frac{\sqrt{3}}{2}$

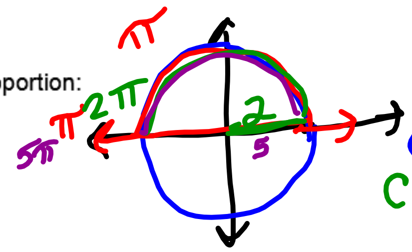
$\sin \frac{5\pi}{6} = \frac{1}{2}$

13.3 Arclength (Day 2)

Warm Up: Convert the angle to degrees. Draw the angle in standard position, as well as the corresponding right triangle. Then find the exact values for cosϴ and sinϴ.

$\theta = \frac{\pi}{3}$

You can find the length of an intercepted arc by using the proportion:



$C = 2\pi r$

$C = 2\pi$

$C = 2 \cdot \pi \cdot 2$
$= 4\pi$

Unit Circle $r = 1$

$s = \theta$

Length of an Intercepted Arc

For a circle of radius r and a central angle of measure ϴ (in *radians*), the length *s* of the intercepted arc is:

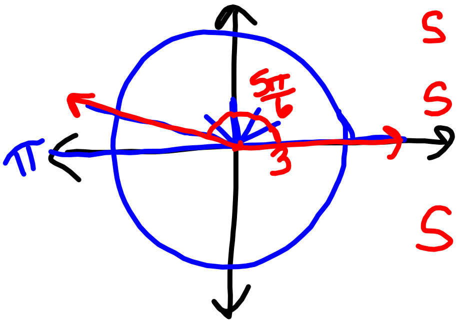
$$\boxed{s = \theta r}$$

$C = 2 \cdot \pi \cdot 5$
$= 10\pi$

Example 4: Finding the Length of an Arc

Find the length of the intercepted arc to the nearest tenth. Sketch a diagram!

a. Given: A circle of radius 3 in, $\theta = \frac{5\pi}{6}$.

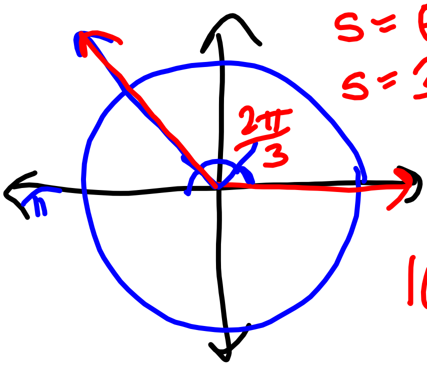


$s = \theta r$

$s = \frac{5\pi}{6}(3)$

$s = 7.9$ in

b. Given: A circle of radius 5m, $\theta = \frac{2\pi}{3}$.



$s = \theta \cdot r$

$s = \frac{2\pi}{3} \cdot 5$

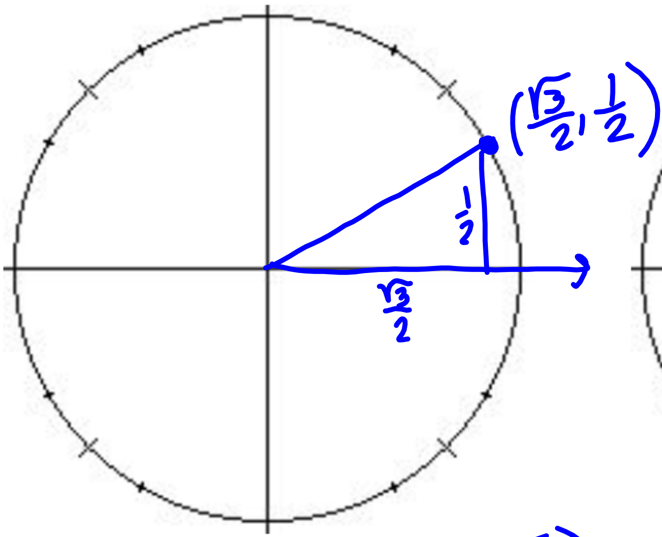
$\frac{10\pi}{3}$ m

10.5m

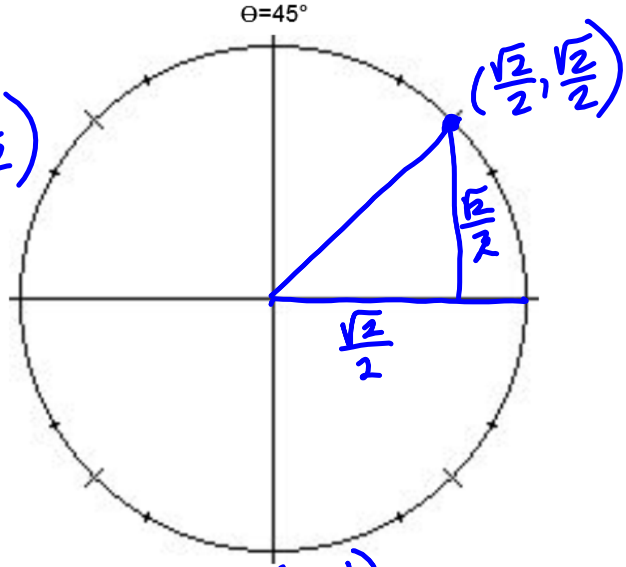
The Unit Circle: radius = 1

If you know quadrant 1, you can derive quadrants 2, 3, 4 by symmetry. Thus, let's study quadrant 1.

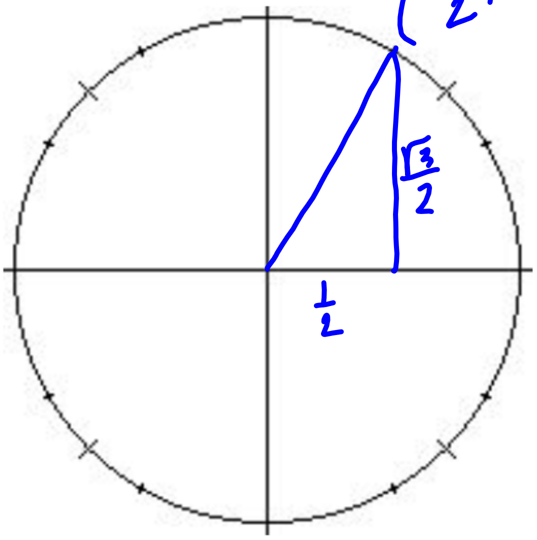
Θ=30°



Θ=45°

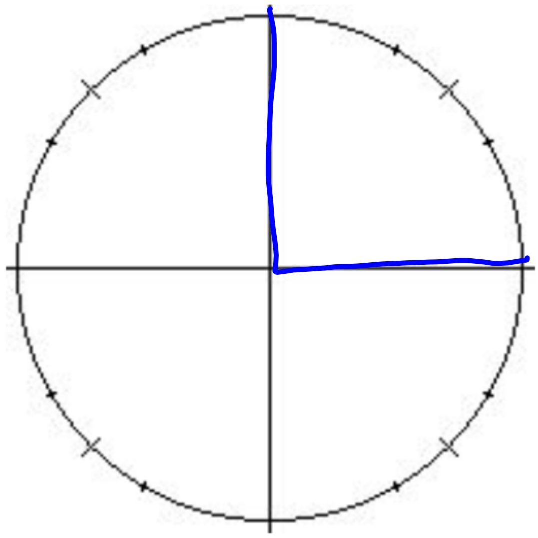


Θ=60° $\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$

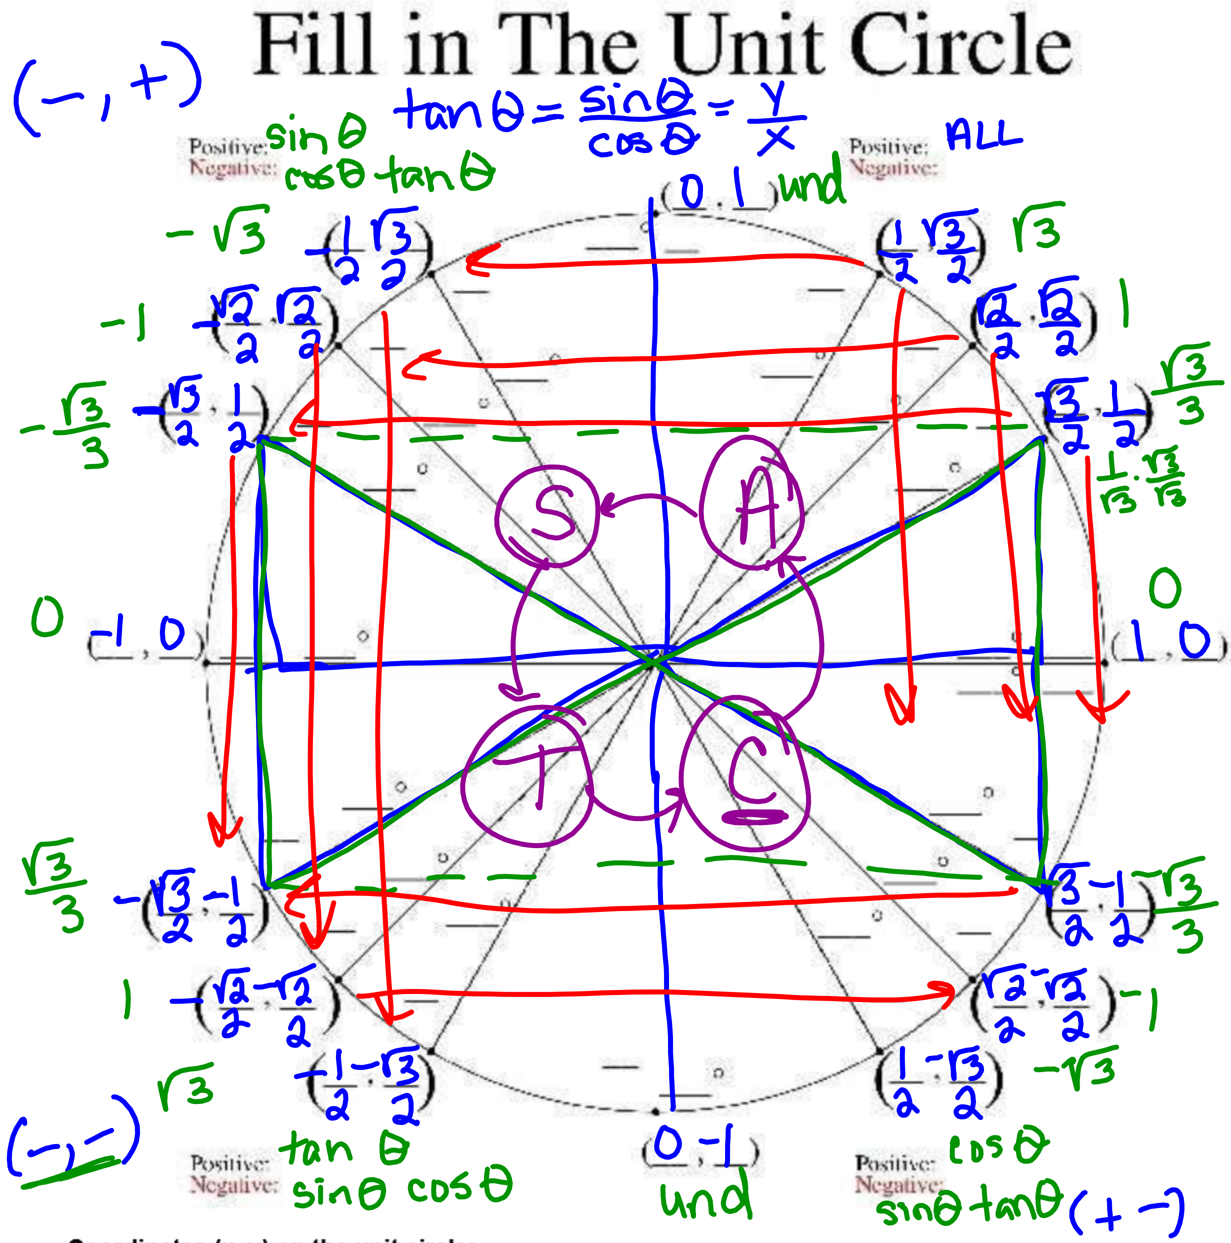


$(0, 1)$

Θ=0° or Θ=90°



Now let's do all four quadrants...



Coordinates (x, y) on the unit circle:

cosΘ = x

sinΘ = y

tanΘ = $\frac{y}{x}$

13.4 The Sine Function (Day 1)

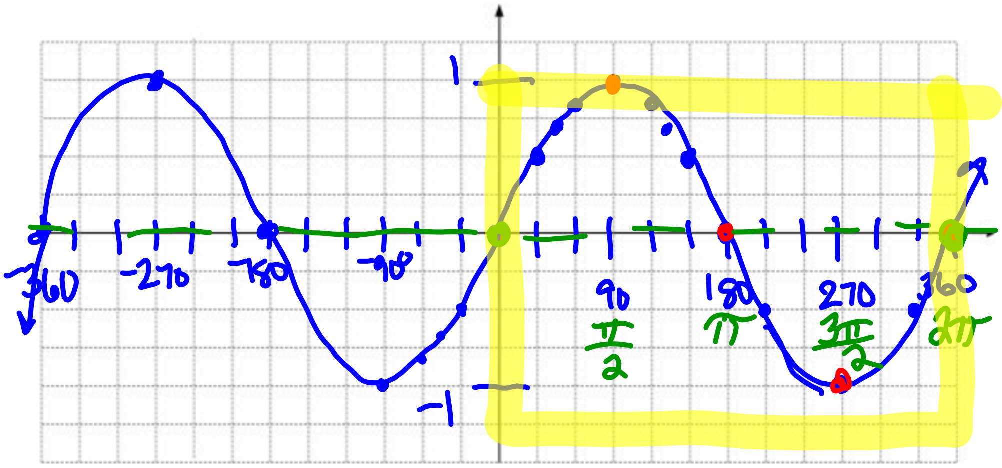
Warm Up: Use the graph. State:

1. the period 360° or 2π
2. the domain ARN
3. the amplitude 1
4. the range $-1 \le y \le 1$ $[-1, 1]$

sine function y=sinΘ: for each measure of Θ, the sine of Θ corresponds with the __y__-coordinates on the unit circle.

y=sinΘ

	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	π	$\frac{3\pi}{2}$	2π
Θ (degrees)	0°	30°	45°	60°	90°	180°	270°	360°
y	0	$\frac{1}{2}$	$\frac{\sqrt{2}}{2}$ 0.707	$\frac{\sqrt{3}}{2}$ .866	1	0	-1	0



Example 1: Interpreting the Sine Function in Degrees

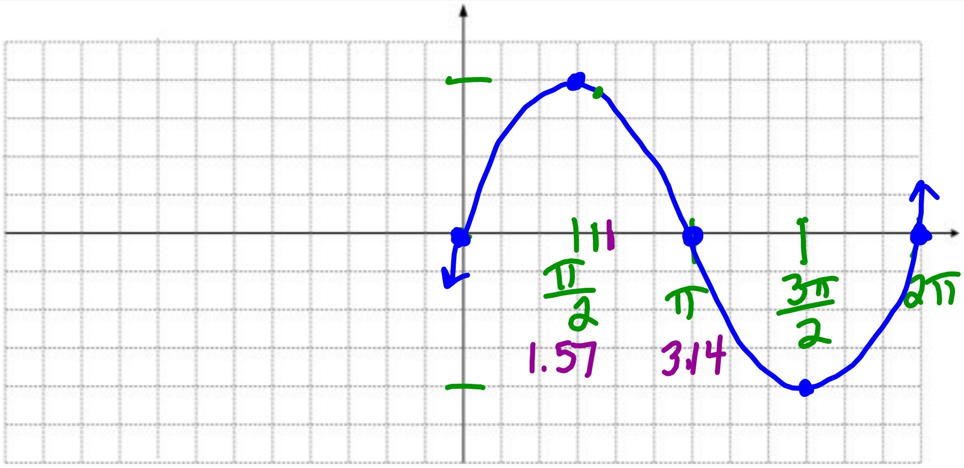
a. What is the value of y=sinΘ for Θ=270°? −1

b. For what values of Θ between 0° and 360° does the graph of y=sinΘ reach
   - the maxiumum value of y=1? 90°
   - the minimum value of y=-1? 270°
   - x-intercept of y=0? aka "zero" 0°, 180°, 360°

Mathematical convention: An angle measure ϴ can be expressed in degrees or in radians. However, when no unit is mentioned, you should use radians. Let's graph the sine function in radians…

y=sinϴ

ϴ (radians)					
y					



Example 2: Estimating Sine Values in Radians

Use your graph above to estimate the value. Check your estimate with a calculator.

a. sin 2 0.8
0.909

b. sin π 0

For the sine function, find the following:

a. amplitude

1

b. period (in degrees and radians)

360°
2π

c. domain and range

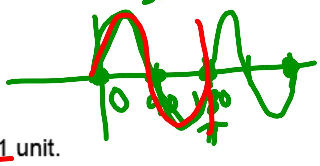
D: ARN
R: [−1, 1]
−1 ≤ y ≤ 1
from to
[0, 5)
0 ≤ y < 5

Properties of Sine Functions

Suppose **y = a sin bθ**, where a≠0, b>0, and θ in radians.

- The amplitude of the function is a
- The number of cycles in the interval from 0 to 2π is b
- The period of the function is $\frac{2\pi}{b}$ $\frac{360}{b}$

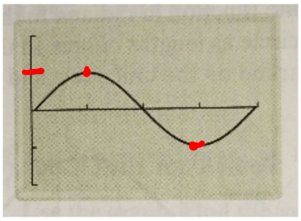
y = sin θ period
360
θ → 2π
sin(2θ) sin 360
360 sin 180



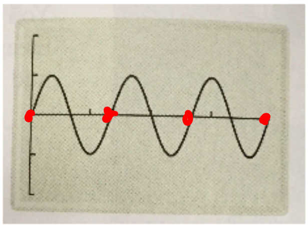
Examples 3&4: Finding the Period and Amplitude of a Sine Function

a. Find the amplitude.
b. How many cycles does the sine function have in the interval from 0 to 2π?
c. Find the period.

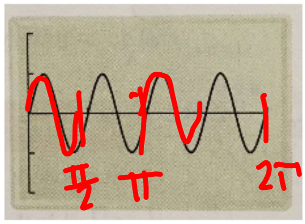
The θ-axis represents values from 0 to 2π. Each interval on the y-axis represents 1 unit.



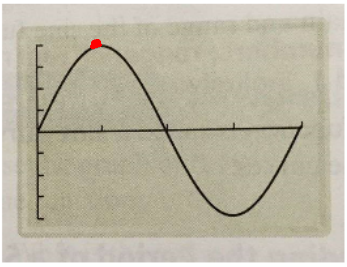
a : 1
bθ b : 1
$\frac{2\pi}{b}$ p : 2π



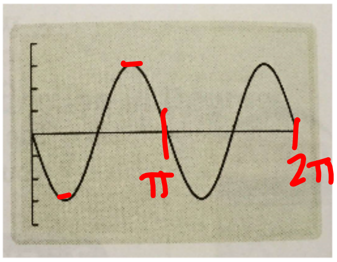
a : 1
b : 3
p : $\frac{2\pi}{3}$



a : 1
b : 4
p : $\frac{2\pi}{4} = \frac{\pi}{2}$



a : 4
b = 1
p : 2π



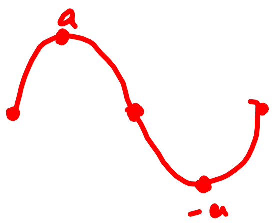
a : 3
b = 2
p = $\frac{2\pi}{2}$ = π

13.4 The Sine Function (Day 2)

II. Graphing Sine Functions

You can use 5 points equally spaced through one cycle to sketch a sine curve. For a>0, this 5-point pattern is zero-max-zero-min-zero.

$y = a \sin b\theta$

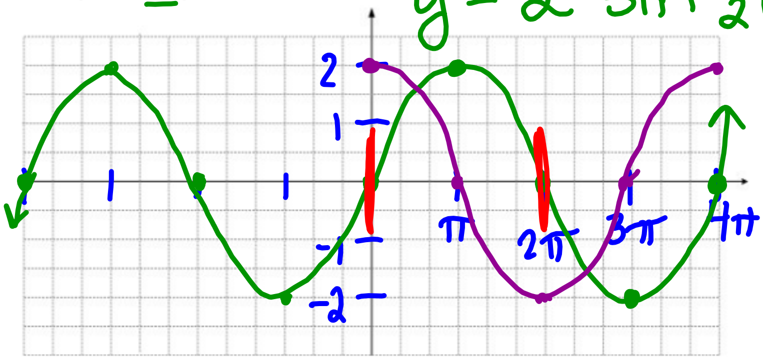


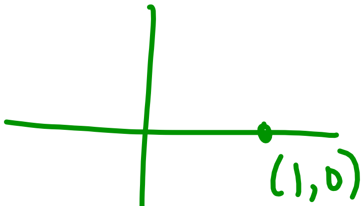
Example 5: Sketching a Graph

Sketch one cycle of each sine curve. Then write an equation for each graph.

a. amplitude 2, period 4π, a>0

$y = 2 \sin \frac{1}{2}\theta$





$\cos 0 = 1$

$\boxed{p = \frac{2\pi}{b}}$

$4\pi = \frac{2\pi}{b}$

$\frac{4\pi b}{4\pi} = \frac{2\pi}{4\pi}$

$b = \frac{1}{2}$

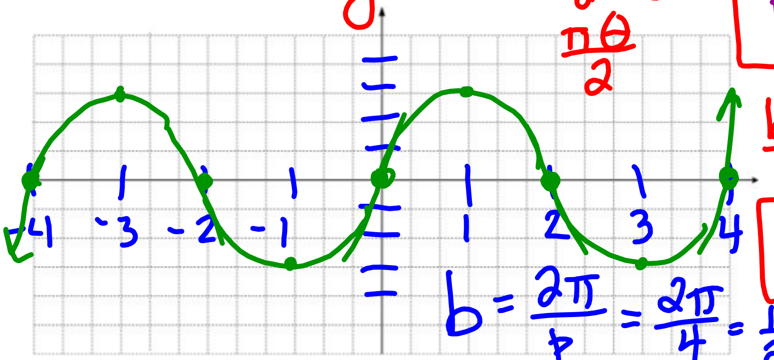
b. amplitude 3, period 4, a>0

$y = 3 \sin \frac{1}{2}\pi\theta$

$\frac{\pi\theta}{2}$

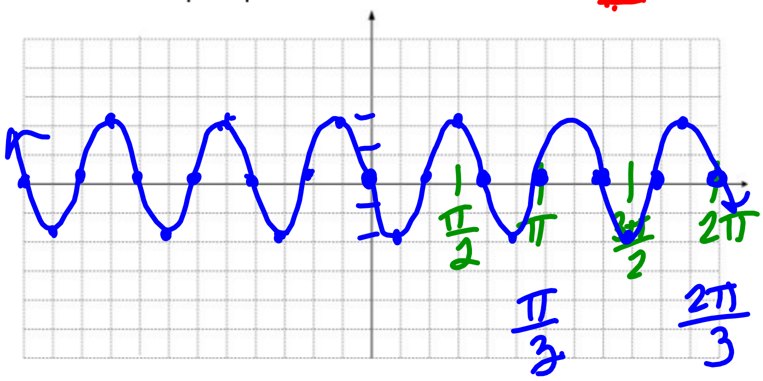
$\frac{bp}{p} = \frac{2\pi}{p}$

$\boxed{b = \frac{2\pi}{p}}$



$b = \frac{2\pi}{p} = \frac{2\pi}{4} = \frac{1}{2}\pi$

c. Predict the 5-point pattern for the sine function when a<0. Then sketch amplitude 2, period 2π/3.



$y = -2 \sin 3\pi$

$b = \frac{2\pi}{\left(\frac{2\pi}{3}\right)} \cdot \frac{3}{2\pi} = 3$

Example 6: Graphing from a Function Rule

Sketch one cycle of the following sine functions.

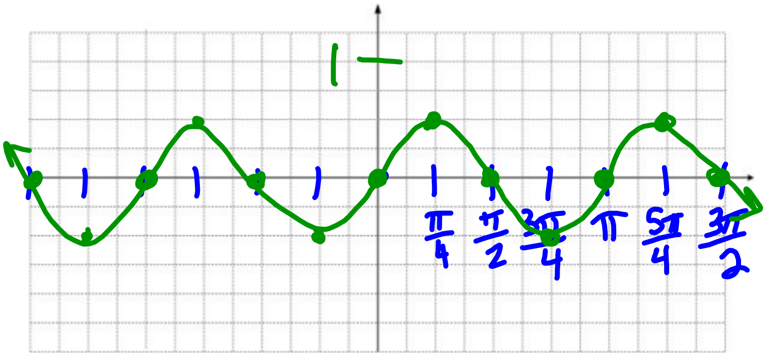
1. $y = \frac{1}{2}sin2\theta$ $b = 2$

amplitude: $\frac{1}{2}$

period: π $p = \frac{2\pi}{b} = \frac{2\pi}{2}$

interval spacing on Θ-axis: $\frac{\pi}{8}$

5-point pattern:



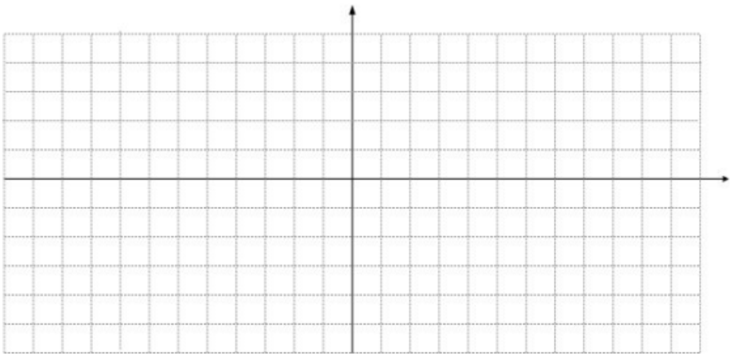
2. $y = 3sin\frac{\pi}{2}\theta$

amplitude:

period:

interval spacing on Θ-axis:

5-point pattern:



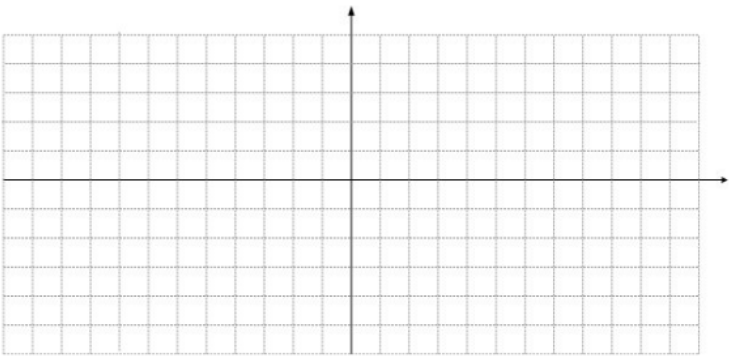
3. $y = -4sin\frac{1}{2}\theta$

amplitude:

period:

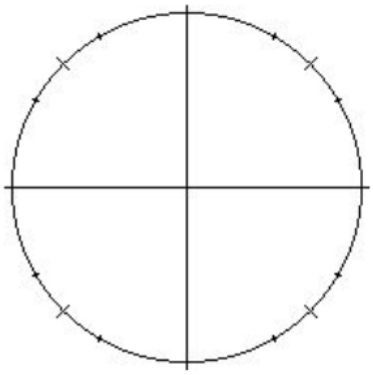
interval spacing on Θ-axis:

5-point pattern:



13.5 The Cosine Function (Day 1)

Warm up: Fill out the unit circle. Evaluate the following angles of cosine.

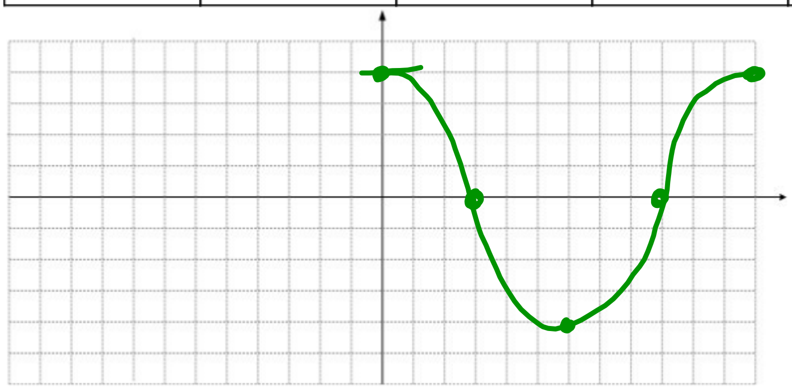


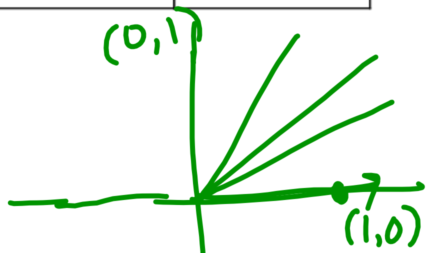
1. $\cos 0^\circ$
2. $\cos 90^\circ$
3. $\cos 180^\circ$
4. $\cos 270^\circ$
5. $\cos 360^\circ$
6. $\cos 0$
7. $\cos \frac{\pi}{2}$
8. $\cos \pi$
9. $\cos \frac{3\pi}{2}$
10. $\cos 2\pi$

Remember: cosΘ equals the ______-coordinate on the unit circle.

I. Graph the cosine function: y=cosΘ

Θ (radians)					
y					





$\cos 0 = 1$

$\cos \frac{\pi}{2} = 0$

Example 1: Interpreting the Graph of y=cosΘ

a. Use your graph above. Find the following:

domain period range amplitude

b. In the interval from 0 to 2π, where do the maximum occur? minimum? zeros?

c. What is the 5-point pattern of the cosine graph?

Properties of Cosine Functions
Suppose **y = *a* cos *bΘ***, where $a \neq 0$, $b > 0$, and Θ in radians.

- The amplitude of the function is _____
- The number of cycles in the interval from 0 to 2π is _____
- The period of the function is _____

Example 2: Sketching the Graph of a Cosine Function
Sketch one cycle of the following cosine functions.

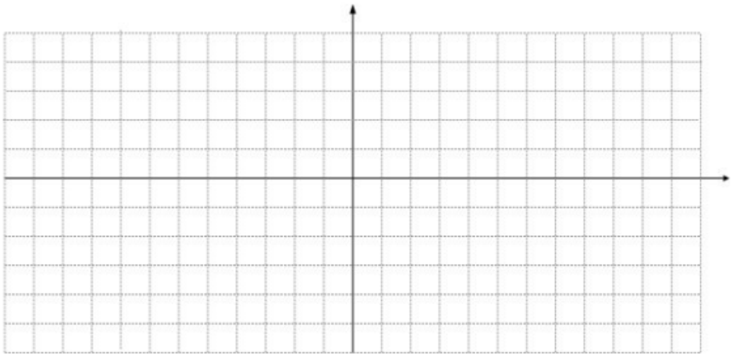
1. $y = cos\frac{\pi}{2}\theta$

amplitude:

period:

interval spacing
on Θ-axis:

5-point pattern:



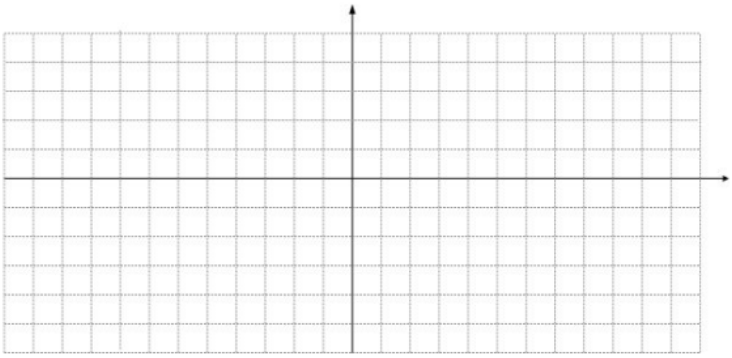
2. $y = -3cos\theta$

amplitude:

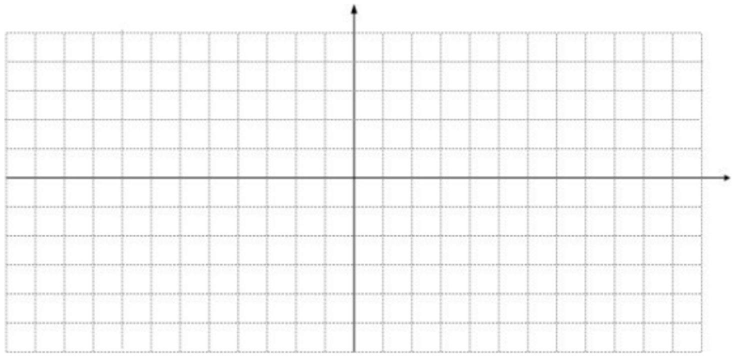
period:

interval spacing
on Θ-axis:

5-point pattern:



3. $y = 1.5cos2\theta$



amplitude:

period:

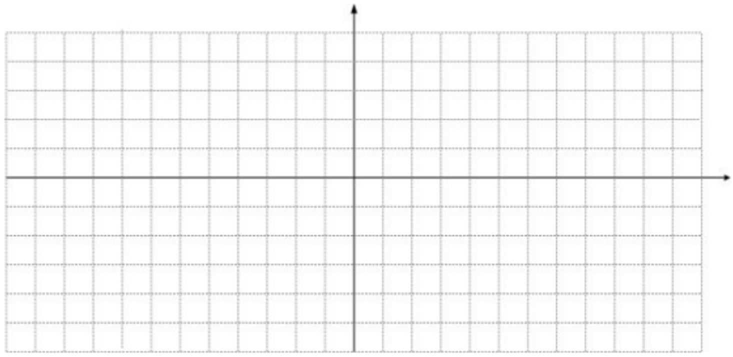
interval spacing
on Θ-axis:

5-point pattern:

13.5 The Cosine Function (Day 2)

Warm up: Graph the following cosine functions.

1. $y = 3cos2\theta$



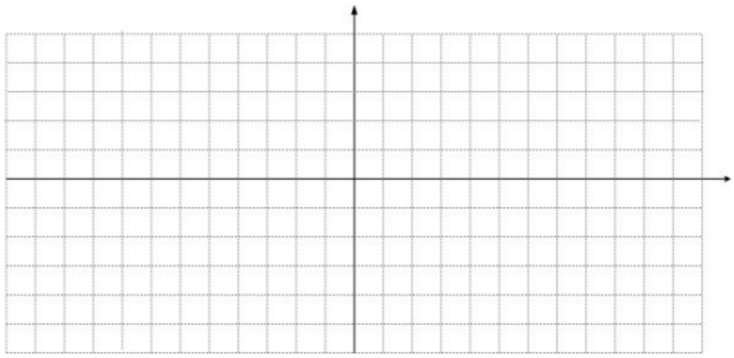
amplitude:

period:

interval spacing
on Θ-axis:

5-point pattern:

2. $y = -2cos\theta$



amplitude:

period:

interval spacing
on Θ-axis:

5-point pattern:

II. Solving Trigonometric Equations

Example 4: Solving a Cosine Equation

Solve the cosine equation in the interval from 0 to 2π. Round to the nearest hundredth. Calculators needed.

a. $-2cos\theta = 1.2$ b. $3cos2t = -2$ c. $5cos\frac{\pi}{2}t = 3$

Identify the period, range, and amplitude of each function.

22. $y = 3cos\theta$

24. $y = 2cos\frac{1}{2}t$

26. $y = 3cos\left(-\frac{\theta}{3}\right)$

28. $y = 16cos\frac{3\pi}{2}t$

13.6 The Tangent Function

Warm up: Use a calculator to find the sine and cosine of each Θ. Then calculate the ratio of sinΘ to cosΘ.

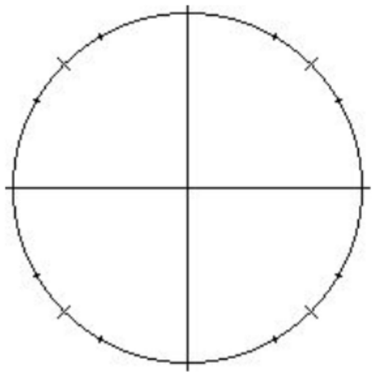
θ	$sin\theta$	$cos\theta$	$\frac{sin\theta}{cos\theta}$
1. $\frac{\pi}{3}$			
2. 30°			
3. 90°			
4. π			
5. $\frac{7\pi}{6}$			

I. The Tangent Function

The cosΘ is derived from the _____ - coordinate of the point on the unit circle.

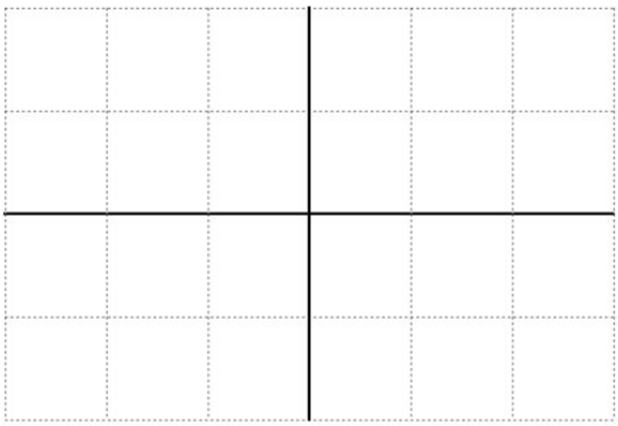
The sinΘ is derived from the _____ - coordinate of the point on the unit circle.

The tanΘ is derived from the ratio of sinΘ to cosΘ. In other words: tanΘ = _________



y=tanΘ

Θ (radians)	0	$\frac{\pi}{4}$	$\frac{\pi}{2}$	$\frac{3\pi}{4}$	π	$-\frac{\pi}{4}$	$-\frac{\pi}{2}$
y							



Features of the parent tangent function:

passes through:

each “branch” is:

x-intercepts (zeros):

vertical asymptotes:

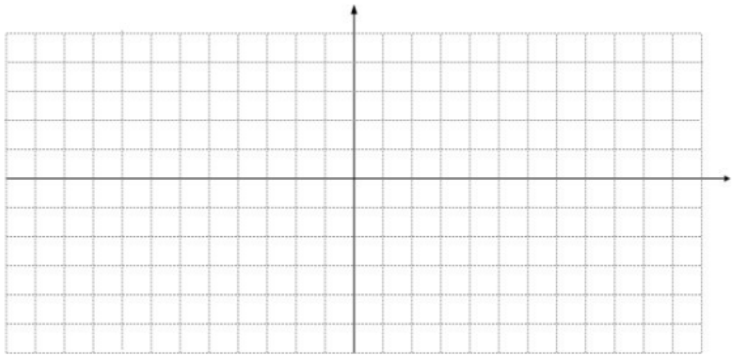
“guide points”:

<u>Properties of Tangent Functions</u>
Suppose **y = *a* tan *bΘ***, where b>0, and Θ in radians.

- The period of the function is _____
- 1 cycle occurs in the interval from _________ to _________
- There are vertical aymptotes at each end of the cycle.
- The pattern is *"asymptote, -a, zero, a, asymptote"*.

Example 2: Graphing a Tangent Function
Sketch 2 cycles of each tangent function.

1. $y = tan\pi\theta$



period:

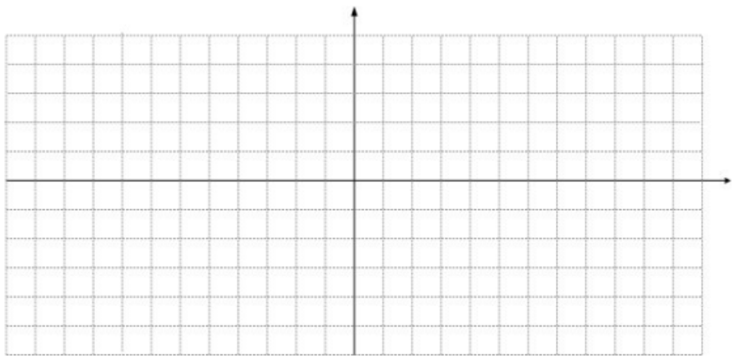
1 cycle: from ______ to ______

VA:

2 guide points:

pattern:

2. $y = tan3\theta$



period:

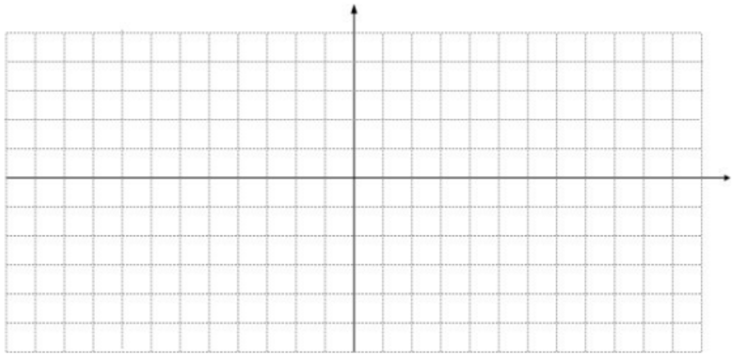
1 cycle: from ______ to ______

VA:

2 guide points:

pattern:

3. $y = tan\frac{\pi}{2}\theta$



period:

1 cycle: from ______ to ______

VA:

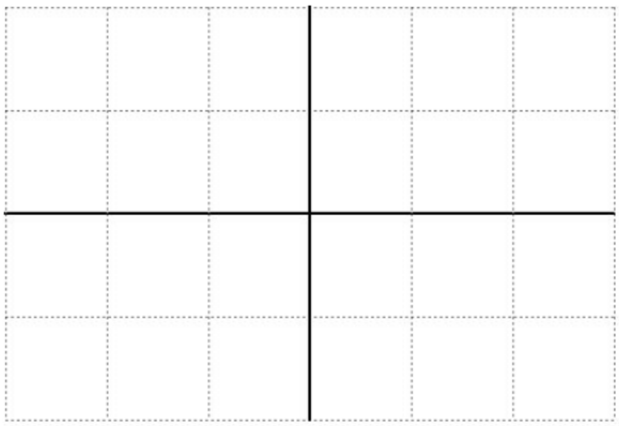
2 guide points:

pattern:

13.7 Translating Sine and Cosine Functions

Warm Up:

1. Graph y=tanΘ … again! (Try not to peek at prior notes.)



Features of the tangent function:

passes through:

each "branch" is:

x-intercepts (zeros):

vertical asymptotes:

"guide points":

2. Compare each pair of equations. State the translations (horizontal, vertical) involved.

a. $y = 2x,\ \ y = 2x + 5$ b. $y = |x|,\ \ y = |x+3|$ c. $y = x^2,\ \ y = x^2 - 4$

d. $y = |x-2| + 1$ e. $y = x^2,\ \ y = (x+3)^2 - 6$ d. $y = f(x),\ \ y = f(x-h) + k$

I. Graphing Translations of Trigonometric Functions

Phase shift - the horizontal translation of a function. If *f(x)* is the "parent", then *f(x-h)* translates horizontally *h* units. For example: *f(x-1)* translates ________________, *f(x+3)* translates ________________.

Vertical shift - the vertical translation of a function. If *f(x)* is the "parent", then *f(x)+k* translates vertically k units. For example: *f(x) - 1* translates ________________, *f(x) + 3* translates ________________.

Example 1: Identifying Phase Shifts and Vertical Shifts

What is the value of *h* and *k* in each translation? Describe the shift i.e. "3 units to the left".

a. f(x-2) b. y= cos(x+4) c. f(t-5) d. y= sin(x+3)

e. f(x) - 2 b. y= cosx + 4 c. f(t) - 5 d. y= sinx + 3

Example 2: Graphing Translations

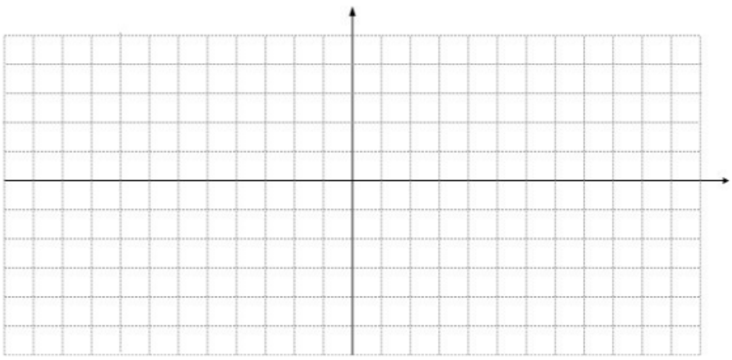
Make a table and then graph the following functions on the same set of axes:

y= sinx

x					
y					

y= sinx + 3

x					
y					

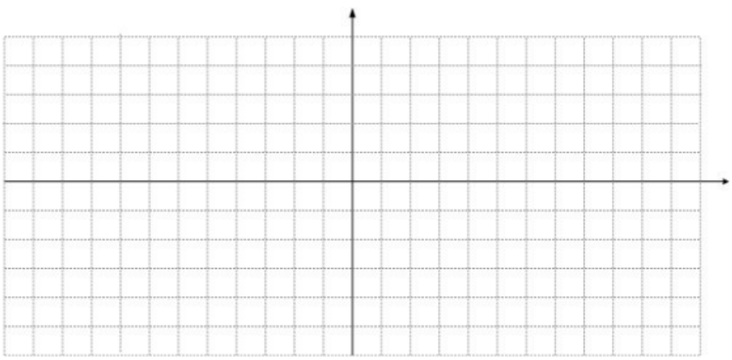


$y = cosx$

x					
y					

$y = cos(x - \frac{\pi}{2})$

x					
y					



Example 3: Graphing a Combined Translation

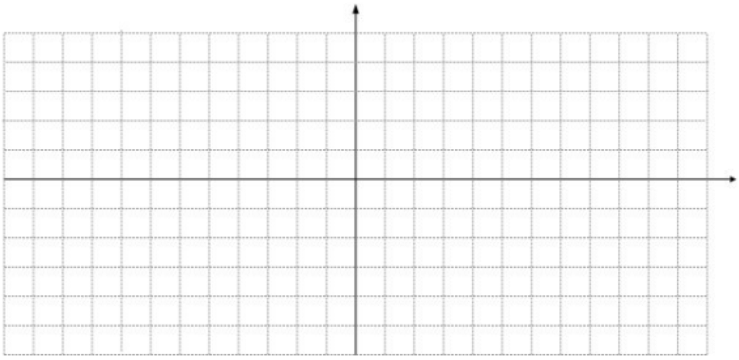
1. $y = sin(x + \pi) - 2$

amplitude:

period:

phase shift:

interval spacing on x-axis:



vertical shift:

5 point pattern:

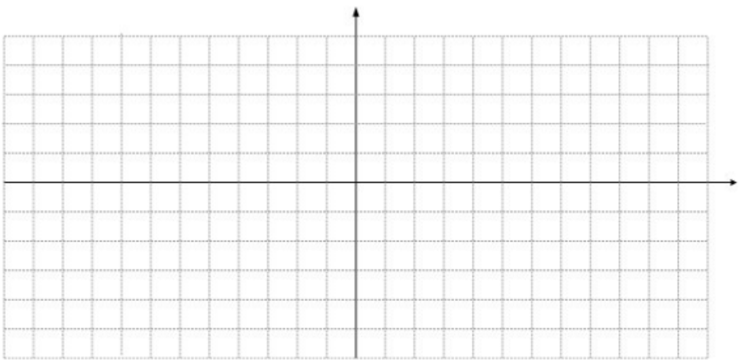
2. $y = 2cos(x - \frac{\pi}{2}) + 3$

amplitude:

period:

phase shift:

interval spacing on x-axis:



vertical shift:

5 point pattern:

<u>Summary: Families of Sine and Cosine Functions</u>

Parent	**Transformed Function**
y=sinx	____________________
y=cosx	____________________

amplitude =

h =

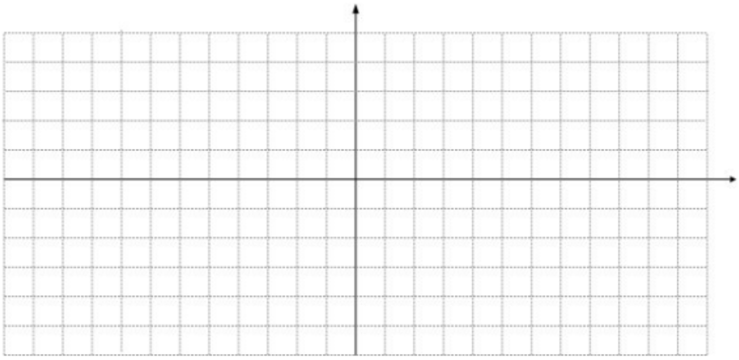
period =

k =

13.7 Translating Sine and Cosine Functions (Day 2)
Warm Up:

$y = -3sin(x + \frac{\pi}{2}) + 2$

amplitude:



period:

phase shift:

interval spacing on x-axis:

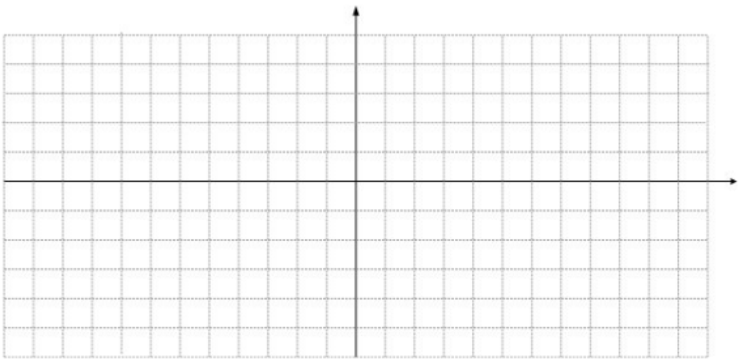
vertical shift:

5 point pattern:

When the phase shift is a pesky number...

$y = sin(x - \frac{\pi}{3})$

amplitude:



period:

phase shift:

interval spacing on x-axis:

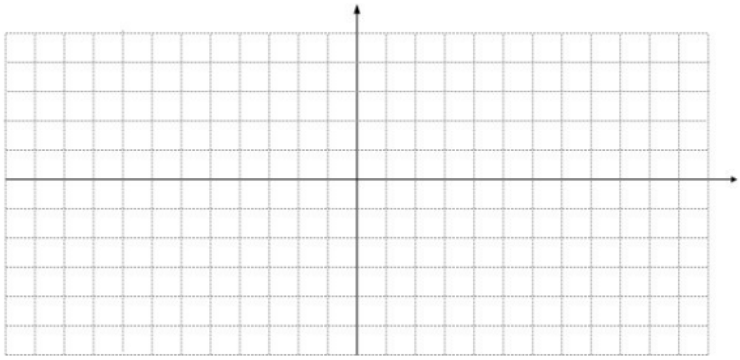
vertical shift:

5 point pattern:

Graphing a translation of y = sin 2x...

$y = sin2(x - \frac{\pi}{3}) - \frac{3}{2}$

amplitude:



period:

phase shift:

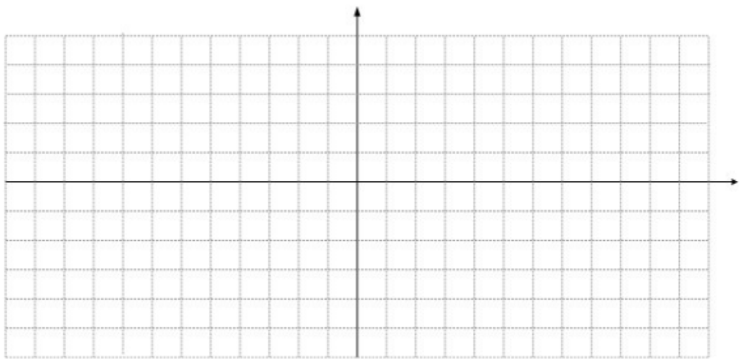
interval spacing on x-axis:

vertical shift:

5 point pattern:

$y =- 3sin2(x - \frac{\pi}{3}) - \frac{3}{2}$

amplitude:



period:

phase shift:

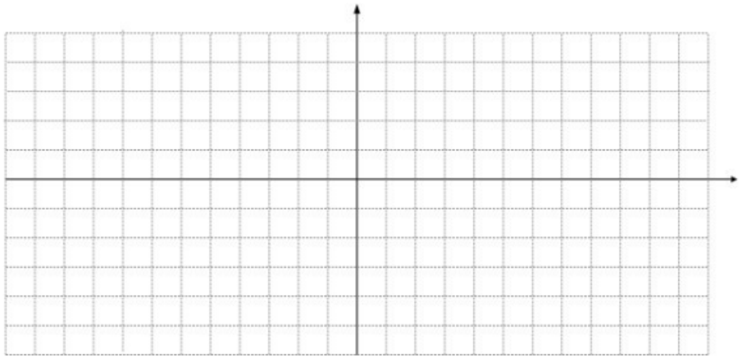
interval spacing on x-axis:

vertical shift:

5 point pattern:

$y = 2cos\frac{\pi}{2}(x+1) - 3$

amplitude:



period:

phase shift:

interval spacing on x-axis:

vertical shift:

5 point pattern:

Example 5: Writing a Translation

Write an equation for each translation.

a. $y = sin\pi,\ \ \pi\ units\ down$

b. $y = -\ cosx,\ \ 2\ units\ left$

c. $y = cosx,\ \ \frac{\pi}{2}units\ up$

d. $y = 2sinx,\ \ \frac{\pi}{4}units\ right$

13.8 Reciprocal Trigonometric Functions
Warm up:
Find the reciprocal of each fraction:

1. $\frac{9}{13}$ 2. $-\frac{5}{8}$ 3. $\frac{1}{2\pi}$ 4. $\frac{14}{-t}$ 5. θ

Name the 3 trigonometric functions you have studied so far:

1. ___________
2. ___________
3. ___________

These 3 trigonometric functions have reciprocals.

Definition: Cosecant, Secant, and Cotangent

Example 1: Using Reciprocals
a. Use your calculator (degree mode). Round your answer to the nearest hundredth.

csc 60° cot 55° sec 15°

b. Suppose $cos\theta = \frac{5}{13}$. Find $sec\theta$. c. Suppose $sin\theta = \frac{-12}{13}$. Find $csc\theta$.

Example 2: Find The Exact Value

csc 30° csc 45° csc 60° csc 90°

sec 30° sec 45° sec 60° sec 90°

cot 30° cot 45° cot 60° cot 90°

Example 3: Using Radians

a. Use your calculator (radian mode). Round your answer to the nearest hundredth.

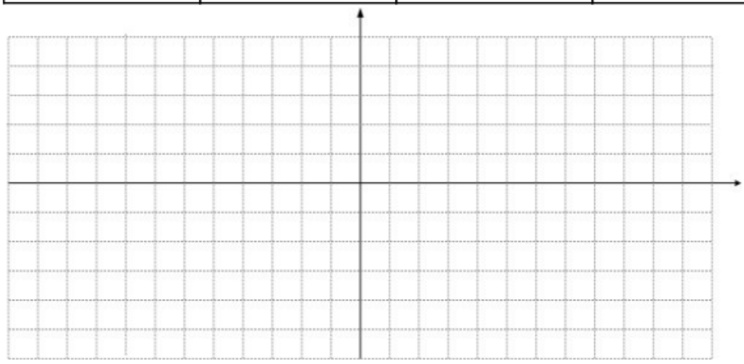
$sec(-1)$ $\quad$ $csc(-1.5)$ $\quad$ $sec2$

b. Find the exact value.

$cot\frac{\pi}{3}$ $\quad$ $cot\pi$ $\quad$ $sec0$

Example 4: Graph The Reciprocal Trigonometric Functions

x	0	$\frac{\pi}{2}$	π	$\frac{3\pi}{2}$	2π
y= sin x					
y= csc x					



x	0	$\frac{\pi}{2}$	π	$\frac{3\pi}{2}$	2π
y= cos x					
y= sec x
